

EP543IC

Encryption Devices Management Center

The EP543IC Management Center is an application which allows the cryptographic maintenance of models EP430DIC and EP960IC IP encryption devices network.

The application must be installed in a secure EP1140 computer over a virtual machine with Linux operative system.

The EP543X must be connected to the red local network of a compatible IP encryption device so that it allows maintaining secure communications with the rest of the encryption devices to be managed.

Reliable Security

- All the information managed by the EP543IC is stored encrypted in the computer EP1140. Thus, all management data in the encryption devices network are ensured.

Configuration

- The EP543IC application disposes of a friendly user interface from which the operator will become quickly familiar when managing the encryption devices network.
- For the encryption devices operation, continuous connection with the Management Center is not required.
