

EP543N

Encryption Devices Management Center

The EP543N Management Center is an application which allows, from a secure EP1140 computer, the cryptographic maintenance of model EP430GN IP encryption devices network.

The application must be installed in a secure EP1140 computer over a virtual machine with Linux operative system.

The EP543N must be connected to the red local network of an EP430GN IP encryption device so that it allows it to maintain secure communications with the rest of the encryption devices to be managed.

Reliable Security

- All the information managed by the EP543N is stored encrypted in the EP1140 computer. Thus, all management data in the encryption devices network are ensured.

Configuration

- The EP543N application disposes of a friendly user interface which allows to manage the encryption devices network.
- For the encryption devices operation, continuous connection with the Management Center is not required.
